Dear Chris,

Thank you for the samples- I was delighted with the results I achieved using Cleanitise to clean my home. It is kind to the skin and has no overpowering odour but shifts grease, dried-on food and residue around baths and sinks effortlessly. I was particularly impressed with the results on our composite stone kitchen worktops and stainless steel appliances, because many products leave smears behind, but Cleanitise does not. It can be used with a wrung out e-cloth on glass shower enclosures with no need to rinse. It's effective and saves time rinsing – great for a busy GP and mother like me.

The UV Blacklight was an extremely effective way of showing up residual dirt both in the home and in a clinical environment . This is a very effective way to test the quality of your cleaning.

Removal of visible dirt is a vital step in infection control procedures and is often overlooked with too much reliance on use of antiseptic solutions etc. I think your cleaning and testing system could prove very useful in the fight to improve cleaning standards in hospitals and lower the rates of hospital-acquired infections. I don't know if you have conducted any trials with the local microbiology department, testing before and after using the Blacklight and Cleanitise, but I think the results would be very interesting!

Best wishes,

Francesca Newman
